of California’s electricity came from renewable sources in 2017.

Renewable energy generation has increased more than 2.5x in the last 10 years, reaching 84,000 GWh in 2017.

California has nearly 30,000 MW of total renewable energy capacity, enough to power more than 11 million homes for a year.

In 2017, solar became the #1 renewable resource, providing 36% of California’s renewable energy.

More than 780,000 small solar systems have been installed at California homes, businesses, and schools. Almost 7000 MW of total capacity.

California leads the nation by requiring the installation of solar on all new homes starting in 2020.
